

## The object graph

## An object's retaining tree

## An object's size

- Two sizes
  - Shallow
    - Just the object
    - Usually a small constant value
  - Retained
    - Sum of shallow size of all descendents
  - Shallow == Retained
    - boolean, number, string variables

## What is **garbage**?

- Garbage: All variables which cannot be reached from the root node.

## Understanding Memory

- All variables are part of the **object graph**
  - **Object** variables can reference other variables
- Objects have two sizes
  - *Shallow* (**self**)
  - *Retained* (**self+descendents**)
- All variables that cannot be reached from the root are **garbage**
- Allocations are cheap until the "**young**" memory pool runs out of memory
  - Garbage collection
